About Me

Ojas Satarkar
Data Science | Software | Finance

I am a Data Engineering and Finance student driven to build data-based solutions that go beyond regular analysis and have practical application. My focus is on transforming complex datasets into systems, models, and tools that support informed decisions, whether that involves improving operational efficiency, understanding market behaviour, or enabling clear strategic insights.. I enjoy working where technical depth meets business context, ensuring the output is accurate and useful.

Pursuing a double degree in Data Science and Finance has influenced my style of approaching problems, which is being analytically rigorous, technically sound and business aware. Through multiple academic projects and hands-on work, I have developed experience in machine learning, data analysis, and software implementation, focusing on building complete solutions rather than individual models.

My goal is to contribute to environments where data, technology and business intersect, designing solutions that are scalable and aligned with real organisational needs, and have an overall positive impact.
